

Introducing Atari's First X-Y Video Game...

TM-136
1st Printing

LUNAR LANDERTM

Operation, Maintenance and Service Manual

Complete with Illustrated Parts Catalog

GAME SERIAL NUMBER LOCATION

Your game's serial number is stamped on the circuit (back) side, bottom right corner, of the printed circuit board—see the illustration above. A serial number (not necessarily the same one) is also stamped on the label located on the rear of the game cabinet. Please mention this number or numbers whenever calling your distributor for service.

location setup

a. new parts

The Lunar Lander™ game has five new Atari parts. If you have worked on Atari video games in the past, then you should be aware of these important differences. The new parts are:

- *Power Supply Assembly.* It covers a wider voltage range than before, has higher reliability, a smaller overall size, and all fuse numbers and fuse amperages are marked directly on the metal chassis.
- *Game PCB Circuitry and TV Monitor.* Most video games to date have used the raster scan method of display. This

game uses vector generation with X and Y axes to allow greater contrast, a greater number of moving objects on the screen, and lines at any angle can be “drawn” on the screen.

- *Thrust Control.* This new design realistically simulates applying engine thrust.
- *Regulator/Audio PCB.* Most of the heat-producing components have been moved off the game PCB and onto this smaller board, so the parts will not be prone to a higher rate of failure.
- *New Speaker Arrangement.* A larger loudspeaker installed in an enclosed wood compartment provides better bass response for the sound. Throughout this manual and illustrated parts catalog, wherever one of these five new parts is mentioned, you will see this symbol in the page margin: 

b. game inspection

This new game is ready to play upon removal from the shipping carton. However, your careful inspection is needed to supply the final touch of quality control. Please follow these steps to help us insure that your new game was delivered to you in good condition.

NOTE

Do not plug the game in yet!

1. Examine the exterior of the game cabinet for dents, chips, or broken parts.
2. Unlock and open the rear access panel of the cabinet and inspect the interior of the game as follows:
 - a. Check that all plug-in connectors (on the game harness) are firmly seated.
 - b. Remove the game printed circuit board (PCB) as follows:
 - Remove the screws at the edge of the PCB closest to you.
 - Unplug the edge connector carefully. DO NOT BEND THE PCB.
 - Slide the PCB out of its slots.
 - c. Verify that all integrated circuits (ICs) are firmly seated in their sockets or soldered in place. You should eliminate any foreign material such as loose bits of wire or solder splashes that could cause unwanted conductive paths.
 - d. Note the location of the game's serial number—it is on the metallic label in the upper left corner on the back of the cabinet. A serial number (not necessarily the same one) also appears in the corner of the back side of the game PCB that is between the two edge connectors. A drawing of this is on the inside

front cover. Please mention this number whenever you call your distributor for service.

- e. Carefully slide the PCB back into its slot in the game cabinet and secure with the two screws at the board's edge closest to you.
- f. Plug the edge connector back onto the PCB. DON'T FORCE IT. The connector is keyed so it will only go on in the proper orientation. A reversed edge connector will damage the PCB.

WARNING

To avoid possible unpleasant electrical shock, do not touch internal parts of the video monitor with your hands or metal objects held in your hands. Check the monitor chassis mounting hardware only.

3. Check all major subassemblies such as the power supply, loudspeaker (which contains powerful magnets that will attract small metal items—remove these items), and all player-operated controls and switches. Check that the video monitor is securely mounted; tighten the hex nuts below the monitor shelf as necessary.

c. voltage selection

Table 1 Installation Requirements

Power	110 VAC, 60 Hz (nominal), 175 watts OR 220 VAC, 50 Hz (nominal), 175 watts
Temperature	0 to 38°C (32 to 100°F)
Humidity	Not over 95% relative
Space Required	65 × 79 cm (25½ × 31 in.)
Game Height	184 cm (72½ in.)

Before plugging in your game, make sure that the voltage selection plug on the power supply is correct for your location's line voltage. Check the wire color on the plug and see if it is correct per the list below.

Line Voltage Range	Voltage Selection Plug Color
90-110 VAC	Violet
105-135 VAC	Yellow
200-240 VAC	Blue
220-260 VAC	Brown

Figure 1 Power Supply

d. interlock and power on/off switch

To minimize the hazard of electrical shock while you are working on the inside of the game cabinet, two interlock

switches have been installed (see Figure 2). One is located behind the rear access panel and one is behind the coin door. These switches remove all the AC line power from the game circuitry when a door is opened.

Check for proper operation of the interlock switches by performing the following steps:

1. Unlock and open the rear access panel and the coin door.
2. Plug the AC line power cord into an AC outlet.
3. Set the on/off switch to its on position.
4. Close the rear access panel and coin door. Within approximately 30 seconds after closing the panel and door, the TV monitor should display a picture (the game lighting should light immediately).
5. Slowly open the rear access panel. The TV monitor picture should disappear and the game lighting should go off when the panel is opened to approximately 2.5 cm (1 inch). Close and lock the rear access panel, and repeat this step with the coin door.

Figure 2 Location of Interlock and Power On/Off Switches

Figure 3 Location of Self-Test Switch and Volume Control

6. If the results of step 5 are satisfactory, the interlock switches are operating properly. If the TV monitor and game lighting don't go off as described, check to see if the corresponding interlock switch is broken from its mounting or stuck in the *on* position.

e. self-test procedure

This game will test itself and provide data to demonstrate that the game's circuitry and controls are operating properly. The data is provided on the TV monitor and the game speakers: no additional equipment is required.

Part of the self-test includes a test of the volume level and a display of the operator-selected game options. Therefore, we suggest you run the self-test anytime you need to adjust the volume or change the options. Besides, this method will eliminate an inaccurate coin count, which would be gotten

by tripping the coin switch wire merely to change the volume level during game play.

To begin the self-test, follow the instructions outlined in Table 2.

Table 2 Self-Test Procedure

Preliminary: With power on, slide self-test switch towards rear of cabinet or on (see illustration). This switch is located on a metal bracket just inside the coin door. Game advances through all tests automatically, except when it fails in Test 1 or 2. In such a case, it will stop wherever it finds a failure. Lunar Lander will not be able to finish the self-test procedure until the defective RAM(s) is replaced.

Name of Test/ Instructions	Result if Test Passes	Result if Test Fails
1. Zero Page RAM Test	Select and Start switches light and stay lit. Screen is blank. Two short medium-high beeps are sounded (3000 Hz).	Screen stays blank and never displays any characters of Test 3. One or both beeps are very high pitch (6000 Hz), meaning bad RAM(s). 1st beep very high = bad RAM at location D2 on game PCB 2nd beep very high = bad RAM at location E2
2. Vector Generator (Screen) RAM Test	Four long medium-high beeps are sounded (3000 Hz).	One or more of the beeps are very high pitch (6000 Hz), meaning a bad vector generator RAM. 1st beep very high = bad RAM at M4 2nd beep very high = bad RAM at R4 3rd beep very high = bad RAM at N4 4th beep very high = bad RAM at P4
3. ROM Test	ROM OK appears in upper left corner of screen. 	☒ is displayed in upper left corner of screen, indicating bad or missing ROM at location N/P3 or PROMs at locations K4 and L4. OR One or more numbers 0 thru 27 will be displayed, indicating a bad ROM or PROM: see <i>Identification of Faulty ROM Chips</i> list on page 8.

Name of Test/ Instructions	Result if Test Passes	Result if Test Fails
4. Option Display	<p>Option settings are displayed in center of screen, as shown in photograph above.</p> <p>The first line shows one of 4 different numbers (see <i>Option Switch Settings</i> list on page 10) or an "X" to indicate free play setting. Message will be in one of four available languages.</p> <p>The second line shows the right coin mechanism factor — it will be 1, 4, 5, or 6.</p>	
5. Thrust Control Test Push thrust control slowly towards rear of game.	The third line shows two characters: they should <i>increase</i> . "Flickering" numbers while control is at rest are unimportant and should be ignored.	Two characters don't change at all, or skip numbers, indicating a dirty potentiometer. <i>Decreasing</i> numbers as you push control means harness wires have been reversed. Thrust control at rest and numbers changing rapidly indicate harness wires are loose.
6. Lamp Audio, and LED Test	<p>Four mission select lamps light sequentially from right to left. (<i>Instructions</i> lamp is always lit.)</p> <p>Engine thrust sound increases with each light from right to left. With <i>Training Mission</i> light on, you'll hear instead the crash sound. Now adjust volume for your location.</p> <p>Between the end and beginning of the four-light sequence, both <i>Select</i> and <i>Start</i> switches go on in unison for a moment.</p>	<p>One or more lights won't go on, indicating a defective light bulb.</p> <p>No engine thrust or crash sound means volume control too low, a defective speaker, loose speaker wires, or a problem in the audio circuitry.</p> <p>One or both of the <i>Select</i> and <i>Start</i> switches do not flash on, indicating bad LED switches or loose harness wires.</p>
7. Switch Test Press each of these switches:	High beep is sounded for each change in switch state, i.e., a push and release should produce two beeps.	No beep indicates a defective switch or loose harness wires.
Slide the self-test switch towards the front of the game or <i>off</i> . Note that using the self-test will cause all the numbers at the top of the screen to reset to zeroes.

No display at all	034573-01 K2 ² 034574-01 P2 ² 034581-01 L1 ² 034582-01 R1 ²	034589-01 ² K2	034569-01 ² B1
		034593-01 ² L1	

¹These chips contain *only* the French, German and Spanish messages. If the game is to be operated in the English language, you do not need to replace them. In fact, they may not even be supplied on a printed circuit board intended for use only in English-speaking areas. Thus in such a case you should ignore the 8 9 10 11 “bad” ROM message.

²ROM or PROMs *must* be in place for self-test to work.

Figure 4 Location of Operator Option Switch

Option Switch Settings

To change the toggle positions of the switch assembly, you need not remove the PCB. The switch, usually colored blue, is easily accessible when the PCB is left mounted in place. Unless you are a qualified technician, *do not turn any of four adjustments knobs near the PCB's edge connector.*

Operator Option Switch Settings

Switch Settings on 8-Toggle DIP Switch (located at position P8 on the game PCB)								Results
8	7	6	5	4	3	2	1	
On On Off Off	On Off On Off	TOGGLE						450 fuel units per coin 600 fuel units per coin 750 fuel units per coin \$ 900 fuel units per coin
			Off On					Free play Coined play as determined by toggles 7 & 8 \$
				Off Off On On	Off On Off On			* German instructions on screen * Spanish instructions on screen * French instructions on screen English instructions on screen \$
						On On Off Off	On Off On Off	Right coin mechanism (as you face the game) registers: 1 credit per coin \$ 4 credit per coin 5 credits per coin 6 credits per coin (Left coin mechanism <i>always</i> registers 1 credit per coin)

**Important:* When changing any instruction language switches, do not worry if the six phrases at the top of the screen still remain in the previous language, and only the *fuel units per coin* phrase has immediately changed. Simply wait until the lunar lander “crashes” (in the attract mode), and the language will reset completely. In free play, the language will not reset until the game’s start button is pressed.

\$ indicates settings made at the factory and/or recommended settings

game play

Lunar Lander™ is a one-player coin-operated electronic game that simulates landing a manned spaceship on the moon. Various video-display phrases indicate score, time elapsed during this landing mission, fuel units consumed, altitude above the moon, and horizontal and vertical speed. The fuel consumption and both speed readings are important for the player to determine how to land the craft. Realistic engine rumble and crash sounds accompany game play. A high beep warns of an almost-depleted fuel supply, whereupon players can add coins to automatically extend the game and “fill up” their fuel tanks. Depending on the quality of the landing or the crash, various messages are displayed on the screen.

The Lunar Lander game has four basic modes of operation: attract, ready-to-play, play and the self-test. The *attract mode* starts after power-up, after the play mode, or after the self-test. It ends when a coin has been inserted into either

Lunar Lander™

coin slot. The *ready-to-play* mode follows the attract mode and begins after a coin has been inserted. It ends with the pressing of the LED start switch.

The *play mode* begins immediately after the ready-to-play mode, when a player presses the start switch. (The game does not automatically start after a certain time has elapsed, i.e., pressing the start switch is the only way Lunar Lander will begin the play mode.) The *self-test* is a special mode used for verifying proper game operation. It begins with the self-test switch set to on, and ends when the switch is set to off.

a. attract mode

The attract mode is specifically programmed to attract potential players by displaying the basic sequence of game play. The lander module flies horizontally across the screen, drifting slowly towards the bottom right corner. At the end it “crashes” into a canyon wall. (The actual slow-motion explosion is not displayed, though, as an incentive for players to try out the game.)

The sequence is reset, and a new landscape panorama is displayed. The center of the screen displays the message *INSERT COINS* and *xxx FUEL UNITS PER COIN* in English or one of three foreign languages. The previous game score is displayed after the word *SCORE* for player encouragement.

b. ready-to-play mode

This mode starts when either coin switch is activated by a coin. The messages *SELECT OPTION*, *PUSH START* and *xxx FUEL UNITS* appear on the screen until a player pushes the LED start switch.

c. play mode

Similar to the attract mode, actual game play begins with engine rumble and the lander drifting towards the bottom

right corner of the screen. Horizontal and vertical speeds are constantly displayed, including two arrows to show horizontal and vertical directions of travel. Altitude is measured in distance above the surface of the mountain — not above “sea level”. The screen also shows time in actual seconds, representing time elapsed in the current mission.

The scoring system gives 50 points for a good landing, plus 50 fuel units as a bonus. A hard landing earns only 15 points, and a crash earns 5 points. A crash happens when the vertical speed exceeds 15 and the horizontal speed exceeds 31. The number displayed after *SCORE* is cumulative of all landings made in the current game. The point scores for a good or hard landing can be greatly increased by landing on an area with a flashing multiplier, for example 2X or 5X. Thus, a good landing on the very narrow 5X site would give that player 250 points.

As already mentioned in Chapter 1, the operator can select from four different settings for fuel units — 450, 600, 750 or 900 fuel units per coin (free play is also available). As the lander module flies over the landscape, it approaches the mountains and a landing site. At a certain point near the mountains, the game “zooms in” for a close-up view of everything on the screen.

If the player realizes the speed is too fast and the landing looks hopeless, he or she can press the *ABORT* button on the control panel. This will give the lander extra thrust and make it fly upwards at top speed. The abort feature does consume 120 to 180 fuel units, though, as a disincentive to overusing it. If the *ABORT* button is pressed too late, however, a crash cannot be avoided.

The four levels of mission difficulty are determined by the player and can be changed at any time during the game or the ready-to-play mode. The differences between the four are printed on the mission select panels and are self-explanatory, except perhaps rotational momentum. This feature causes the lander to tumble around when either *ROTATE* button is pushed. The longer either button is held down, the faster the lander module will spin in that direction. The player gains control of the lander by pressing the other *ROTATE* button for the same amount of time.

maintenance and adjustments

Due to its solid-state circuitry, this Atari unit should require very little maintenance and only occasional adjustment. Information given in this chapter and elsewhere in this manual is intended to cover most servicing situations that may be encountered at the game site. The procedures given are in sufficient detail to be understood by a person with moderate technical background.

a. cleaning

The exterior of the game cabinet and the three acrylic panels may be cleaned with any non-abrasive household cleaner. If desired, special coin machine cleaners that leave no residue can be obtained from your distributor. Do *not* dry-wipe any of the acrylic panels, because any dust can scratch the surface and result in fogging the plastic.

b. fuse replacement

This game contains six fuses—all on the power supply assembly (not including the TV monitor fuses). Replace fuses only with the same type as listed below. See the Electrohome TV monitor manual for the monitor fuse data.

F1, F2, F3	7-amp. 250V 3AG slow-blow glass cartridge-type fuse
F4, F5, F6	3-amp. 250V 3AG slow-blow glass cartridge-type fuse

The metal power supply chassis is marked with all six fuse numbers and their amperages. Figure 16 shows the power supply in detail, including top and bottom views.

c. control panel access

Prior to repairing or replacing any component on the control panel or prior to removing the TV monitor, unplug the game. Then open the coin door.

Reach through the opening and remove all four sets of wing nuts, split lock washers, and flat washers, located on the underside of the control panel (see Figure 5). The two carriage bolts closest to the front of the game will come out of the control panel; at this point in the procedure the rear two bolts are left as installed.

Lift up on the control panel and tilt it towards you. *Be sure that the acrylic TV monitor shield does not fall on you.* The top edge of the control panel acts as a retainer strip for the shield: once the control panel is opened, the shield is free and could slide out under its own power.

1. LED Switch Replacement

The light-emitting diode (LED) switches on the control panel have a very low failure rate. In case a switch should

ever be suspect, first test it per the description that follows. To replace the switch, refer to Figure 5.

1. Remove the wires from the suspected switch.
2. Set multimeter to ohms scale. Set ohms scale to $R \times 1$, then zero the meter.
3. Connect multimeter leads to appropriate LED switch contacts. (See Figure 5 for designation of switch contacts and meter lead placement.)
4. Check contacts (push and release the switch button) for closed and open continuity.
5. If the contacts do not operate sharply or always remain closed or open, then replace the LED switch as outlined in Figure 5.

2. Mission Select PCB Lamp Replacement

With the control panel open, be sure power is turned off. Unplug the harness connectors closest to this PCB. Carefully remove both cross-recessed screws plus the four fiber washers used to mount the board. Replace any of the burned-out lamps. (See Figure 5.)

To re-install the board, *be sure* the edge with the harness wires faces down towards the floor. Place a fiber washer on either side of the board's mounting hole, insert each screw and fasten the board down onto the wood framework of the control panel. Re-plug the harness connector together again.

3. Thrust Control Maintenance and Repair

To maintain this control, you will only have to lubricate the nylon bearings and the springs approximately every

LED SWITCH TESTING

- Remove all wires from the faulty switch.
- Turn the switch counterclockwise while holding the cone-shaped nut on the outside of the control panel.
- Install a new switch using the reverse procedure.
- Reconnect the harness wires.

SINGLE-POLE DOUBLE-THROW (SPDT)
SWITCH WITH INTERNAL LED

Figure 5 Opening and Removing Parts
from the Control Panel

2500 credits or \$625 in income earned. The number of credits can be read off the coin counter, located on the coin door. For the thrust control, use only a small amount of *Dow Silicon Grease Type 14770-79*, Atari part no. 78-1708. Refer to Figure 6 for exactly where to lubricate the thrust control.

Lubricate Springs. Open the control panel and be sure the game's power is turned off. For lubrication you do *not* need to remove the whole thrust control assembly. To lube the springs, remove both by slipping them sideways off the ends of the pins. Then apply a small amount of the Dow silicon grease to the two outer recessed grooves on each pin that holds the springs. (See the heavy arrows in Figure 6.)

Lubricate Nylon Bearings. The large pin that is protected by white nylon bearings must be removed before

you can lubricate it. First remove the two springs, then the Allen-head screw and split lock washer in the center of the handle. While holding the control's handle, carefully pull out the pin that rides on the bearings. Be aware that the flat white washers may fall onto the control panel as you remove this pin. Now apply grease only where the bearings normally ride. Reassemble the handle, pin, screw and washers in reverse order.

Repairs on this control, if any, would probably be replacing a broken spring or potentiometer, or trading/replacing neoprene stops that have become dented. Replacing springs has already been explained above.

Potentiometer Replacement. To determine if the potentiometer is defective, run the self-test (see Table 2). If the numbers displayed on the screen are in erratic sequence as

Figure 6 Thrust Control Lubrication and Repair

you move the handle slowly forwards and backwards, then the pot is bad. Simply remove the harness wires on the pot, then remove the hex nut and flat washer that mount the pot on the black metal bracket. Slide the pot out sideways and replace it with a new one. **Note that this potentiometer has been modified to include a tiny pin:** an off-the-shelf pot cannot be used for this game! Replace with Atari part no. A034117-01.

Neoprene Stop Replacement. The neoprene stop most likely to wear is that on which the handle sits when in its rest position. The lifespan of this stop can be increased by trading it with the other stop. To trade or replace the stops, remove the E-rings at the ends of the pins. Pull the pins out sideways and replace the stops.

Thrust Control Removal. If you ever need to remove the entire thrust control assembly from the game, be sure the power is turned off first. Remove the harness wires on the potentiometer. Then remove the four sets of hex nuts, split lock washers and carriage bolts from the thrust control assembly. Lift the control and its black plastic cover out of the control panel. (See Figure 5.)

d. tv monitor replacement

If you should need to service or replace the Electrohome X-Y monitor, you must first remove it from the game cabinet. Follow the instructions below, and refer to Figure 7.

Figure 7 TV Monitor Removal

1. Open the control panel as described in Section C, Control Panel Access. *Be sure the game is unplugged from its wall outlet!*

CAUTION

High voltages may exist in any television unit, even with power disconnected. Use extreme caution and do not touch electrical parts or the TV yoke area with your hands or with metal objects in your hands!

2. Remove the acrylic TV monitor shield by sliding its lower edge out.
3. Working up from the bottom side corners, carefully pry loose the two side flaps of the black cardboard bezel. (A 4-inch strip of double-sided adhesive tape is centered behind both side flaps, flush with each edge.) Remove the bezel.
4. Open the rear access panel and unplug the following two TV monitor harness connectors: one is a 6-pin connector on the TV's vertically-mounted PCB, the other is a 6-pin connector in the harness, about 6 inches away from the large TV monitor capacitors.
5. Remove the four sets of carriage bolts, flat and split lock washers, and hex nuts that hold down the metal TV chassis.
6. Carefully slide the TV monitor chassis out the front of the game.

e. printed circuit board replacement

You may wish to remove the game printed circuit board (PCB) or the Regulator/Audio PCB for service or inspection. To do this, refer to Figure 8 and proceed as follows:

1. Open the rear access panel.
2. Locate the securing screws and fiber washers that hold down the PCB in its slots, and remove them. (The game PCB has two, the Regulator/Audio PCB has one set of this fastening hardware.)
3. Unplug the edge connector or the three small harness connectors; then carefully slide the PCB straight out of its slots. Be careful not to twist the board, as this may loosen connections or components.
4. Replace or repair as required.
5. Reinstall the PCB, making sure that the connectors are properly plugged in. Note they are keyed to fit on only one way, so if they don't slip on easily, don't force them! *A reversed connector may damage the game.*

Figure 8 Removing Printed Circuit Boards

6. Replace the securing screws and fiber washers in the PCB.
7. Close and lock the rear access panel.
8. Check that the operation of the game is correct and *perform the self-test*. This is especially important with any game when you replace a PCB. Normally the *only* adjustments on the Lunar Lander game PCB are option switch changes (made on the 8-toggle DIP switch). Unless you are a qualified technician, *do not turn any of the four knobs* near the PCB's edge connector.

f. fluorescent tube replacement

To replace the white fluorescent tube behind the graphics attraction panel, follow this procedure (see Figure 9):

1. Remove the three Allen-head screws at the top of the game. They secure the metal retainer for the silk-screened panel. Remove the retainer completely.
2. Tilt the top of the acrylic panel towards you, then lift it up and out of the bottom retainer.

CAUTION

If you drop a fluorescent tube and it breaks, it will explode! Shattered glass can fly 6 feet or more from the explosion. Use care when replacing any fluorescent tube.

3. Remove the two grey clips from the fluorescent tube. Now turn the tube one quarter turn in either direction. Remove the tube and both orange clips.
4. Replace with a new tube. If you move games a lot from one location to another, you should re-use the orange

and grey clips. They provide extra protection against vibration loosening the tube out of its fixture.

5. Close up the game by following these instructions in reverse order.

g. speaker replacement

Probably the only cause of speaker failure is an electrical short or a ruptured cone, but both of these failures are highly unlikely. If the loudspeaker should ever need to be replaced, removal is very simple.

Remove the six sets of black Allen-head screws and split lock washers that secure the speaker grille. Now remove the four cross-recessed screws that hold down the speaker. Remove the harness "Fast-On" connectors on the speaker and replace this speaker.

Note that Lunar Lander™ has an empty area above the speaker and a smaller hole to the left of the speaker opening. This arrangement improves the audio's bass response: the space enables the engine thrust to have a realistically deep rumble. Therefore, do not cover up the left-hand hole with anything other than the speaker grille.

Figure 9 Fluorescent Tube Replacement

details of operation

With this manual you received two large sheets that contain the wiring and schematic diagrams for the Lunar Lander™ game. Sheet 1, Side A, includes an index that shows the arrangement of these diagrams. The diagrams include information that explains the functions of the circuits and defines where the inputs are from and where the outputs go. We hope these larger schematics solve the problems some technicians were experiencing with the smaller diagrams in our previous manuals. By putting them on large sheets, we were able to make them much easier to read, as well as maintaining smoother continuity from one circuit function to another.

Lunar Lander™

a. description of an x-y game

As stated on the front cover of this manual, this is Atari's first X-Y game. What's the difference between an X-Y game and Atari's previous games? To answer this, let's first discuss our previous games.

1. The Raster-Type Game

All previous Atari video games utilized a raster-scan monitor. These games contained a monitor that internally produces signals that scan the beam across the face of the picture tube screen. The beam, as in your home TV, starts at the top left corner of the screen, moves horizontally across to the right of the screen, turns off, moves down a little while returning to the left of the screen, turns on, and again, moves to the right of the screen. This is repeated until the beam reaches the bottom right corner. The beam is then turned off while it is moved all the way back to the top of the screen, then the process is repeated over and over. The result is many horizontal lines (240 lines is typical in our raster games) on the surface of the screen, scanned so fast that the screen appears to be lighted all the time.

In these games, the game PCB electronic circuitry is synchronized with the beam and turns the beam on and off, as required to produce the appropriate game video.

2. The X-Y-Type Game

This type of game utilizes a monitor known as an X-Y monitor. In the X-Y game, the first thing you will notice is that the picture tube beam is not continuously scanned. Therefore, the game PCB does not contain a standard sync circuit. Instead of the beam being internally controlled by the monitor, the game PCB controls the location of the beam at all times. As in the raster-scan monitor, the yoke of the X-Y monitor deflects the beam. The picture of the X-Y game is produced by drawing vectors on the surface of the monitor screen. This is done by the vector generator circuitry of the game PCB. This circuitry locates the beam in steps. There are 1024 steps for the horizontal location of the beam, and 768 steps for the vertical location. Therefore, there are 786,432 resolution bits (768 x 1024) on the surface of the X-Y monitor screen. Since our typical raster-scan game has only 61,440 resolution bits (256 line bits x 240 lines), the X-Y game is capable of developing a picture with much finer detail.

The vector generator draws vectors on the monitor by turning the beam on while deflecting the beam horizontally and/or vertically. An increase of the horizontal deflection current moves the beam to the right. Decreasing this current

moves the beam to the left. Increasing the vertical deflection current moves the beam up. Decreasing this current moves the beam down. Increasing both deflection currents simultaneously at the same rate results in a vector that slopes upward and to the right at a forty-five degree angle. By controlling the amount of horizontal and vertical deflection current, the vector generator is capable of "drawing" a line between any two given points on the monitor screen.

The X axis output of the vector generator is the horizontal axis of the monitor, while the Y axis is the vertical. The Z axis output of the vector generator controls the brightness of the beam. Without the brightness control, a short vector drawn in the same amount of time as a long vector would result in the short vector being brighter than the long vector.

b. game wiring and power distribution

The wiring diagram for the Lunar Lander game is located on Sheet 1, Side A, of the large sheets that came with this manual. Included on this sheet are the schematics for the power supply, Regulator/Audio PCB, Mission Select PCB, and coin door.

Figure 10 of this manual shows the distribution of the power of this game.

c. description of electronic assemblies

The following section describes the electronic assemblies within the Lunar Lander game. Some of these new designs are, X-Y monitor, Regulator/Audio PCB, X-Y game PCB, and Power Supply. For information concerning the X-Y monitor, please refer to the monitor manual that is included with the game.

Figure 11 of this manual shows the distribution of signals of the game.

1. Power Supply

The Power Supply is located on the floor of the game cabinet. This supply was specifically designed to provide the voltages required for both raster and X-Y games. Some of the features of this new supply include: a new transformer with greater power output and additional secondary windings; one unregulated DC voltage output, and various AC voltage outputs; a line filtered AC line input; appropriate

Figure 10 Power Distribution

Figure 11 Signal Distribution

voltage selection plugs for four different ranges of AC line voltages; and a bank of fuses located on an easily accessible fuse block, with fuse values plainly labeled beside each fuse. (See Chapter 1, Section C, for location of power supply fuses and instructions for the voltage selection plug.)

2. Regulator/Audio PCB

The Regulator/Audio PCB is the smaller PCB, located on the left wall (standing in front of the game) of the cabinet. It was designed for two reasons: 1) to remove high-heat-producing components from the game PCB, and 2) to provide better regulation of the +5 VDC logic power for the game PCB. A description of both the regulator and audio sections of the PCB is included on Sheet 1, Side A, of the large sheets included with this manual. The schematic for the audio section is repeated on Side B of the sheet.

3. Control Panel

The control panel on the front of the game includes the Lunar Lander Mission Select PCB, Thrust Control, and four LED pushbutton switches.

The Mission Select PCB contains five #1816 lamps. Lamp 1, the INSTRUCTIONS lamp, is always on, as it is connected between +10.3 VDC and two diodes to ground. The other four lamps are lighted by signals LAMP2 thru LAMP5 from the output of the game PCB. These lamps are connected between +10.3 VDC and the collector of a transistor for each lamp. When the base of a transistor is low, the associated lamp is off. When the base voltage goes high, the lamp lights.

The Thrust Control contains a 5K ohm potentiometer that is connected between +5 VDC and ground. The wiper of the potentiometer is connected to the POTIN input of the game PCB. There is no calibration necessary for this control.

The four pushbuttons on the control panel each have light-emitting diodes (LEDs) inside their buttons. The ROTATE LEFT and ROTATE RIGHT switches are always lighted. The SELECT and START switches are lighted by the START/SELECT output signal from the game PCB. When this signal is high, the LEDs in both the SELECT and START switches are unlighted. When this signal is low, both switches are lighted.

4. Game PCB

The game PCB is the larger PCB located on the left wall of the cabinet. This PCB contains power input regulators, a microcomputer, audio generator circuit, vector generator (actually a second microcomputer), and video output circuit.

a. Power Input and Game Output

The power input circuitry to the game PCB is described on Sheet 1, Side B, of the large sheets included with this manual. Also included on this side of Sheet 1 is the schematic and functional descriptions of the game PCB's mission select output, audio output, and video output.

b. The Microcomputer

The microcomputer of the game PCB consists of a microprocessing unit (MPU), a clock circuit, a power reset and watchdog counter, NMI counter, address decoding circuit, program ROM memory, and program RAM memory. See Sheet 2, Side A of the large sheets for the schematic diagram and functional descriptions of this circuitry. This sheet also includes the schematic diagram and functional descriptions for the player control inputs to the game PCB.

A memory map is included in the address decoding circuit block of the microcomputer schematic. The memory map identifies the addresses that the MPU uses to gain access to its peripheral circuits. The ones and zeroes in the ADDRESS column indicate the address necessary for information to be passed to and from the MPU. A zero indicates that the address line is low, and a 1 indicates the line is high. Blank spaces indicate that it doesn't matter whether the address line is low or high. An A indicates that the address line is used as part of the functional address for that particular peripheral access. In the DATA column, a D indicates that the data line is used to transfer information.

c. The Vector Generator

The inputs and outputs of the vector generator circuitry are defined on Sheet 2, Side B, of the schematic package with this manual. This circuit is in itself a semi-smart microcomputer. It receives instructions from the "game" microcomputer and once instructed what it is to do, it executes the instruction. When it is finished, it tells the microcomputer, via the HALT signal from the SINP1 switch input port, that it is through and is waiting for its next instruction.

All of the picture data on the monitor screen is stored in the program memory of the vector generator. The vector generator RAM receives information from the game microcomputer that tells it what video should be displayed, i.e., rotation of the lunar lander, amount of lunar lander thrust, messages to be displayed on the monitor, etc. The vector generator then accesses this appropriate video stored in its ROM memory and outputs it to the X-Y monitor display.

illustrated parts catalog

The purpose of this chapter is to provide you with the necessary information for ordering replacement parts for the Lunar Lander™ game.

When ordering parts from your distributor, give the part number, part name, applicable figure number of this catalog, and serial number of your game. This will help to avoid confusion and mistakes in your order. We hope the results will be less downtime and more profit from your game.

Parts List

Item	Part No.	Qty.	Description	Location
31	24-250107	1	100 μ f Aluminum Electrolytic Fixed Axial-Lead 25V Capacitor	(C49)
32	24-250477	2	470 μ f Aluminum Electrolytic Fixed Axial-Lead 25V Capacitor	(C65, 66)
33	27-250104	66	.1 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C1-14, 16-19, 22-25, 29-36, 38-41, 43, 45-28, 51, 53-56, 58-63, 67, 68, 71, 74-76, 79-83, 86-89, 95)
34	27-250103	2	.01 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C42, 90)
35	28-101100	2	10 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C78, C85)
36	28-101101	2	100 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C44-C92)
37	28-101271	1	270 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C37)
38	28-101391	1	390 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C69)
39	29-006	1	1.0 μ f, \pm 10%, 35V Tantalum Capacitor	(C15)
40	21-101473	1	.047 μ f Radial-Lead Epoxy-Dipped 100V Mylar Capacitor	(C91)
41	28-101680	2	68 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C93, C94)
42	31-1N914	2	75V 1N914 Switching Diode	(CR1, 12)
43	31-1N4001	4	50V 1N4001 Silicon Rectifier Diode	(CR6-9)
44	32-1N756A	2	8.2V, \pm 5%, 1N756A Zener Diode	(CR10, 11)
45	32-1N5235	1	6.8V, \pm 20%, 1N5235 Zener Diode	(CR2)
46	33-2N3906	2	Type 2N3906 PNP Switching and Amplifying Transistor	(Q1, Q5)
47	34-2N6044	1	Type 2N6044 Darlington NPN Transistor	(Q4)
48	28-101221	2	220 pf Radial-Lead Epoxy-Dipped 100V Mica Capacitor	(C77, C84)
49	37-74LS00	3	Type 74LS00 Integrated Circuit	(C6, N6, R9)
50	37-74LS02	1	Type 74LS02 Integrated Circuit	(D6)
51	37-7404	2	Type 7404 Integrated Circuit	(H10, B5)
52	37-74LS04	1	Type 74LS04 Integrated Circuit	(L5)
53	37-74LS08	3	Type 74LS08 Integrated Circuit	(E6, K6, B8)
54	37-74LS10	1	Type 74LS10 Integrated Circuit	(A8)
55	37-74LS14	1	Type 74LS14 Integrated Circuit	(B6)
56	37-74LS20	1	Type 74LS20 Integrated Circuit	(E5)
57	37-74LS32	2	Type 74LS32 Integrated Circuit	(M5, B9)

¹These chips contain *only* the French, German and Spanish messages. If the game is to be operated in the English language, you do not need to replace them. In fact, they may not even be supplied on a printed circuit board intended for use only in English-speaking areas. Thus in such a case you should ignore the 8 9 10 11 "bad" ROM message.

²ROM or PROMs *must* be in place for self-test to run properly.

**Figure 16 X-Y Game Power Supply Assembly
Parts List**

Item	Part No.	Qty.	Description
A	A034955-01	1	Power Supply Sub-Assembly, consisting of the following 17 items:
1	034482-01	1	Base for Power Supply Chassis
2	79-4411006	1	Panel-Mounting Non-Indicating 3AG Cartridge-Type Fuse Post
3	79-3206	1	5-Position 3AG Fuse Block with 1/4" Quick-Disconnect Terminals
4	46-2017002	3	7-Amp. 250V 3AG Slow-Blow Glass Cartridge-Type Fuse
5	46-2013002	3	3-Amp. 250V 3AG Slow-Blow Glass Cartridge-Type Fuse
6	29-053	1	26,000 μ f 15V Electrolytic Capacitor
7	78-70501SC	1	2" Diameter Capacitor Mounting Bracket
8	79-15021001	1	2-Circuit Single-Row Terminal Block
9	78-2708	1	Nylon Type 6/6 Hole Bushing with 5/8" Inside Diameter \times 55/64" Outside Diameter \times 1/4" Thick
10	A006555-01	1	Rectifier Printer Circuit Board Assembly
11	72-HA4804S	3	#8-32 \times 1/4" Cross-Recessed Pan-Head Zinc-Plated Steel Thread-Rolling Tri-Fluted "Taptite" Screw
12	72-HA4812S	1	#8-32 \times 3/4" Cross-Recessed Pan-Head Zinc-Plated Steel Thread-Rolling Tri-Fluted "Taptite" Screw
13	72-1008F	2	#10-32 \times 1/2" Cross-Recessed Pan-Head Zinc-Plated Steel Machine Screw
14	72-HA4606S	4	#6-32 \times 3/8" Cross-Recessed Pan-Head Zinc-Plated Steel Thread-Rolling Tri-Fluted "Taptite" Screw
15	75-010S	2	#10 Flat Plain Regular-Pattern SAE-Standard Zinc-Plated Steel Washer
16	75-018S	4	#8 Flat Plain Regular-Pattern SAE-Standard Zinc-Plated Steel Washer
17	75-99518	1	#8-32 Nut/Washer Assembly
B	A034630-01	1	RFI Filter Assembly
C	A034629-01	1	A.C. Harness Assembly
D	A034623-02	1	Power Supply Harness Assembly (for X-Y Games)
E	034544-01	1	Fuse Block Cover
F	75-018S	4	#8 Flat Plain Regular-Pattern SAE-Standard Zinc-Plated Steel Washer
G	75-99518	4	#8-32 Nut/Washer Assembly
H	72-HA4814S	2	#8-32 \times 7/8" Cross-Recessed Pan-Head Zinc-Plated Steel Thread-Rolling Tri-Fluted "Taptite" Screw

13	11-5221	2	220 Ohm, $\pm 5\%$, $\frac{1}{2}$ W Carbon Composition Resistor	(R9, 21)
15	12-52P7	1	2.7 Ohm, $\pm 5\%$, 1W Carbon Composition Resistor	(R5)
16	19-100P1015	1	.1 Ohm, $\pm 3\%$, 7W Wirewound Resistor	(R24)
17	19-315102	1	1K Ohm Vertical PCB-Mounting Cermet Trimpot, Bournes Series 3352V-1-1K	(R8)
20	24-250106	2	10 μ f Aluminum Electrolytic Fixed Axial-Lead 25V Capacitor	(C6, 15)
22	24-250477	3	470 μ f Aluminum Electrolytic Fixed Axial-Lead 25V Capacitor	(C1, 4, 12)
23	24-250108	3	100 μ f Aluminum Electrolytic Fixed Axial-Lead 25V Capacitor	(C9, 10, 13)
25	27-250103	2	.01 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C5, C14)
26	27-250104	2	.1 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C3, C11)
27	27-250224	2	.22 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C8, 17)
29	27-250102	3	.001 μ f Ceramic-Disc 25V Radial-Lead Capacitor	(C2, 7, 16)
31	31-A14F	2	50V 2.5A Miniature Axial-Lead High-Current Rectifier	(CR1, CR4)
32	31-1N4001	2	50V Silicon Rectifier 1N4001 Diode	(CR2-3)
34	33-TIP32	1	PNP Power Transistor, Type TIP32	(Q2)
35	34-2N3055	1	NPN Silicon Transistor, Type 2N3055	(Q3)
36	34-2N3904	2	NPN Silicon Transistor, Type 2N3904	(Q4, 6)
38	37-LM305	1	5V Linear Voltage Regulator	(Q1)
39	37-TDA2002A	2	Type TDA2002A 8W Linear Audio Amplifier Integrated Circuit	(Q5, 7)

Parts List

Item	Part No.	Qty.	Description	Location
44	79-58008	1	9-Position Connector Receptacle	(J7)
45	79-58092	1	6-Position Connector Receptacle	(J6)
46	79-58059	1	4-Position Connector Receptacle	(J8)
47	79-20230	19	Female PCB-Mounting Terminal	
48	034531-01	1	Heat Sink	
49	72-1608C	4	#6-32 × 1/2" Cross-Recessed Pan-Head Corrosion-Resistant Steel Machine Screw	
50	75-99516	7	#6-32 Nut/Washer Assembly	
51	75-056	7	#6 Internal-Tooth Steel Lock Washer	
52	020670-01	6	Test Point	
53	75-F60805	3	#6-32 × 1/2" Binder-Head Nylon Screw	
57	78-16008	1	Thermally Conductive Compound for the 2N3055	
58	78-16014	3	Thermally Conductive Compound for TDA2002A and TIP32	
60	52-003	2	Teflon-Insulated Solder-Plated Solid Copper PCB-Mounting Jumper Wire with .6" Centers	
61	52-004	2	Teflon-Insulated Solder-Plated Solid Copper PCB-Mounting Jumper Wire with .3" Centers	

YOUR COMMENTS, PLEASE!

Your comments will assist Atari in improving the usefulness of our publications. They are an important part of preparing for revisions of manuals and parts catalogs. No postage stamp is necessary if mailed in the U.S.A.

If you have any technical questions about certain Atari or Kee Games products, or are requesting additional publications, we will immediately forward your note to the appropriate person.

WARRANTY

Seller warrants that its printed circuit boards and parts thereon are free from defects in material and workmanship under normal use and service for a period of ninety (90) days from date of shipment. Seller warrants that its television monitors (in games supplied with monitors) are free from defects in material and workmanship under normal use and service for a period of thirty (30) days from date of shipment. None of the Seller's other products or parts thereof are warranted.

If the products described in this manual fail to conform to this warranty, Sellers' sole liability shall be, at its option, to repair, replace, or credit Buyer's account for such products which are returned to Seller during said warranty period, provided:

(a) Seller is promptly notified in writing upon discovery by Buyer that said products are defective;

(b) Such products are returned prepaid to Sellers' plant; and

(c) Seller's examination of said products discloses to Seller's satisfaction that such alleged defects existed and were not caused by accident, misuse, neglect, alteration, improper repair, installation or improper testing.

In no event shall Seller be liable for loss of profits, loss of use, incidental or consequential damages.

Except for any express warranty set forth in a written contract between Seller and Buyer which contract supersedes the terms of this order, this warranty is expressed in lieu of all other warranties expressed or implied, including the implied warranties of merchantability and fitness for a particular purpose, and of all other obligations or liabilities on the Seller's part, and it neither assumes nor authorizes any other person to assume for the Seller any other liabilities in connection with the sale of products under this order.

The use of any non-Atari parts may void your warranty, according to the terms of the warranty. The use of any non-Atari parts may also adversely affect the safety of your game and cause injury to yourself and others. Be very cautious in using non-Atari-supplied components with our games, in order to insure your safety.

Atari distributors are independent, being privately owned and operated. In their judgment they may sell parts or accessories other than Atari parts or accessories. Atari cannot be responsible for the quality, suitability or safety of any non-Atari part or any modification including labor which is performed by such distributor.

This document is and contains confidential trade secret information of Atari, Inc.

This document is loaned under confidential custody for the sole purpose of operation, maintenance or repair of Atari equipment and may not be used by or disclosed to any person for any other purpose whatever, and remains the property of Atari, Inc.

Neither it nor the information it contains may be reproduced, used, or disclosed to persons not having a need to know consistent with the purpose of the loan, without written consent of Atari, Inc.
